

Deadtime Analysis Progress

8/9/2017

Salina Ali, Mongi Dlamini

Left High Resolution Spectrometer (LHRS)

S2M&&CER

Analog Ring Sampler (ARS)

if ARS: valid

Master OR (scaler/counter)

Trigger Setup

- Borrowed from <https://hallaweb.jlab.org/wiki/index.php/Trigger>

Deadtime Computations

- Looking at scaler rates: live and raw

$$\text{Raw rate} = \text{Live rate} \cdot \frac{1}{1 - \text{Dedtime}}$$

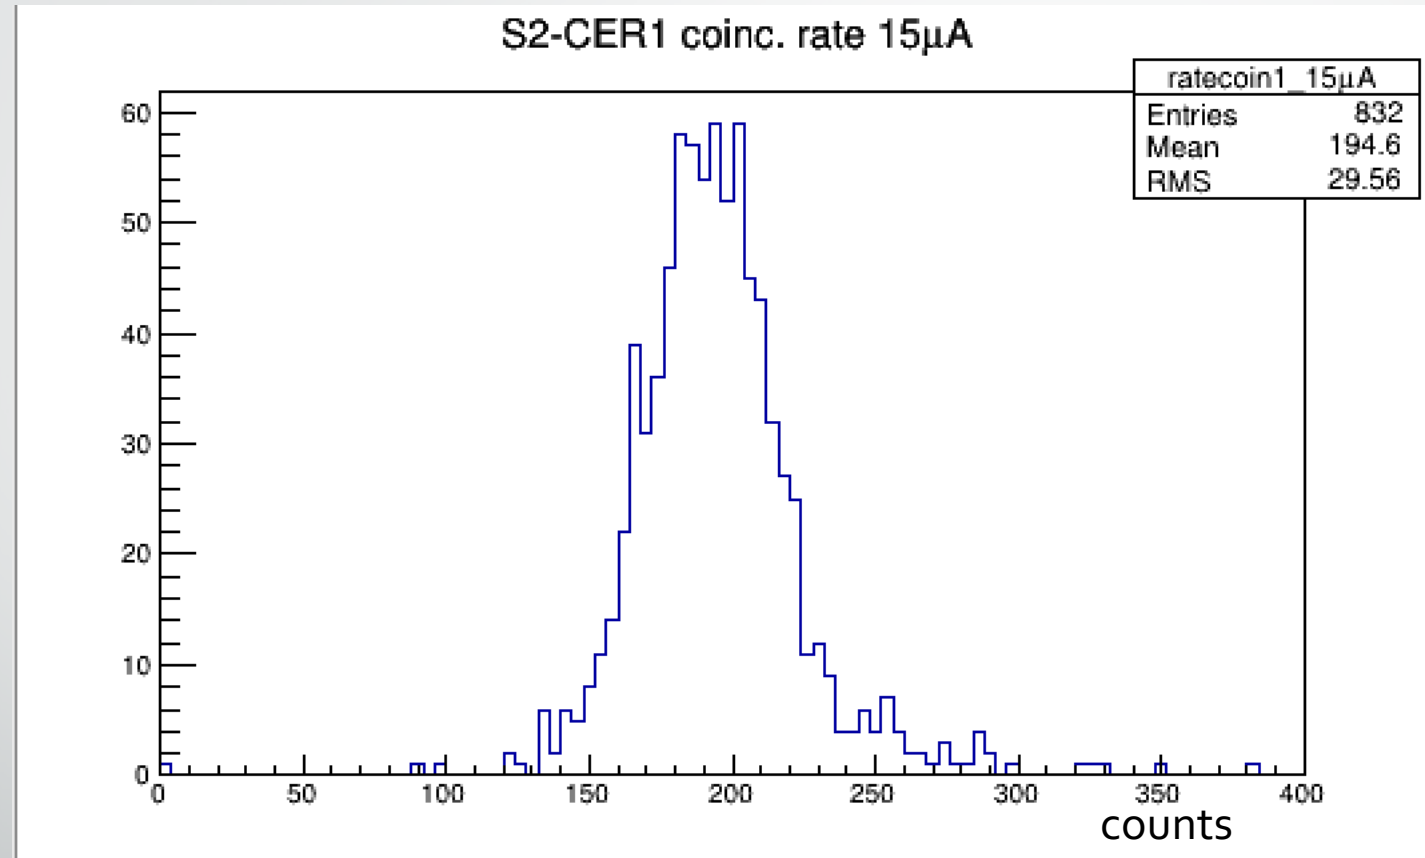

- Livetime and dedtime:

$$\text{Livetime} = \frac{\text{Live Scaler Rate}}{\text{Raw Scaler Rate}}$$

$$\text{Dedtime} = 1 - \text{Livetime}$$

Run#: 13418 (2016)

- Example of a scaler histogram:

- Run 13418 was taken at 3 different currents, 10, 15, 20 μ A
- Took mean of each histogram to get live/raw rates

Live and Scaler rates

- Livetime Computations:

I (uA)	S2M LT	So LT	S2M&&Cer LT	Master OR LT
10.61	0.985	0.984	0.983	0.983
15.32	0.976	0.975	0.973	0.972
20.53	0.965	0.963	0.963	0.963

- Observations: Increasing deadtime with increasing current: current dependence?

- Found current normalized raw rates..and current dependence still present in S2m&&CER, Master OR.

I(uA)	S2m raw norm (Hz/uA)	so norm raw (Hz/uA)	s2m&&cer raw norm (Hz/uA)	Master OR raw norm (Hz/uA)
0	212 Hz	101.8 Hz	13.9 Hz	23.4 Hz
10.61	592	186	11.6	11.5
15.32	591	187	12.1	12.4
20.53	591	186	12.6	12.9

- First row is pedestal rate which is not normalized, and every other rate is pedestal subtracted.

CODA-based event rates

- Current normalized rates still current dependent, so looking at CODA events now.

I (uA)	S2M & Cer LT	CODA event rate: no cuts(Hz/uA)	Master OR Raw norm (Hz/uA)
0	0.997	16.26 Hz	23.4 Hz
10.61	0.985	9.27	11.5
15.32	0.976	10.26	12.4
20.53	0.965	11.26	12.9

Should be the same!!

- An explanation for this may be the randomly-counting scalers.

Random-counting scalers

- Example of a scan of a scaler, “S2M&Cer live” randomly counting from run 13418.
- Currently looking at more live scalers to see if problem persists.

```
(LONGON_0725
root [6] T->Scan("cptS2M_CER_Live")
*****
*      Row      * cptS2M_CE *
*****
