

# Aerogel

7/25/2013

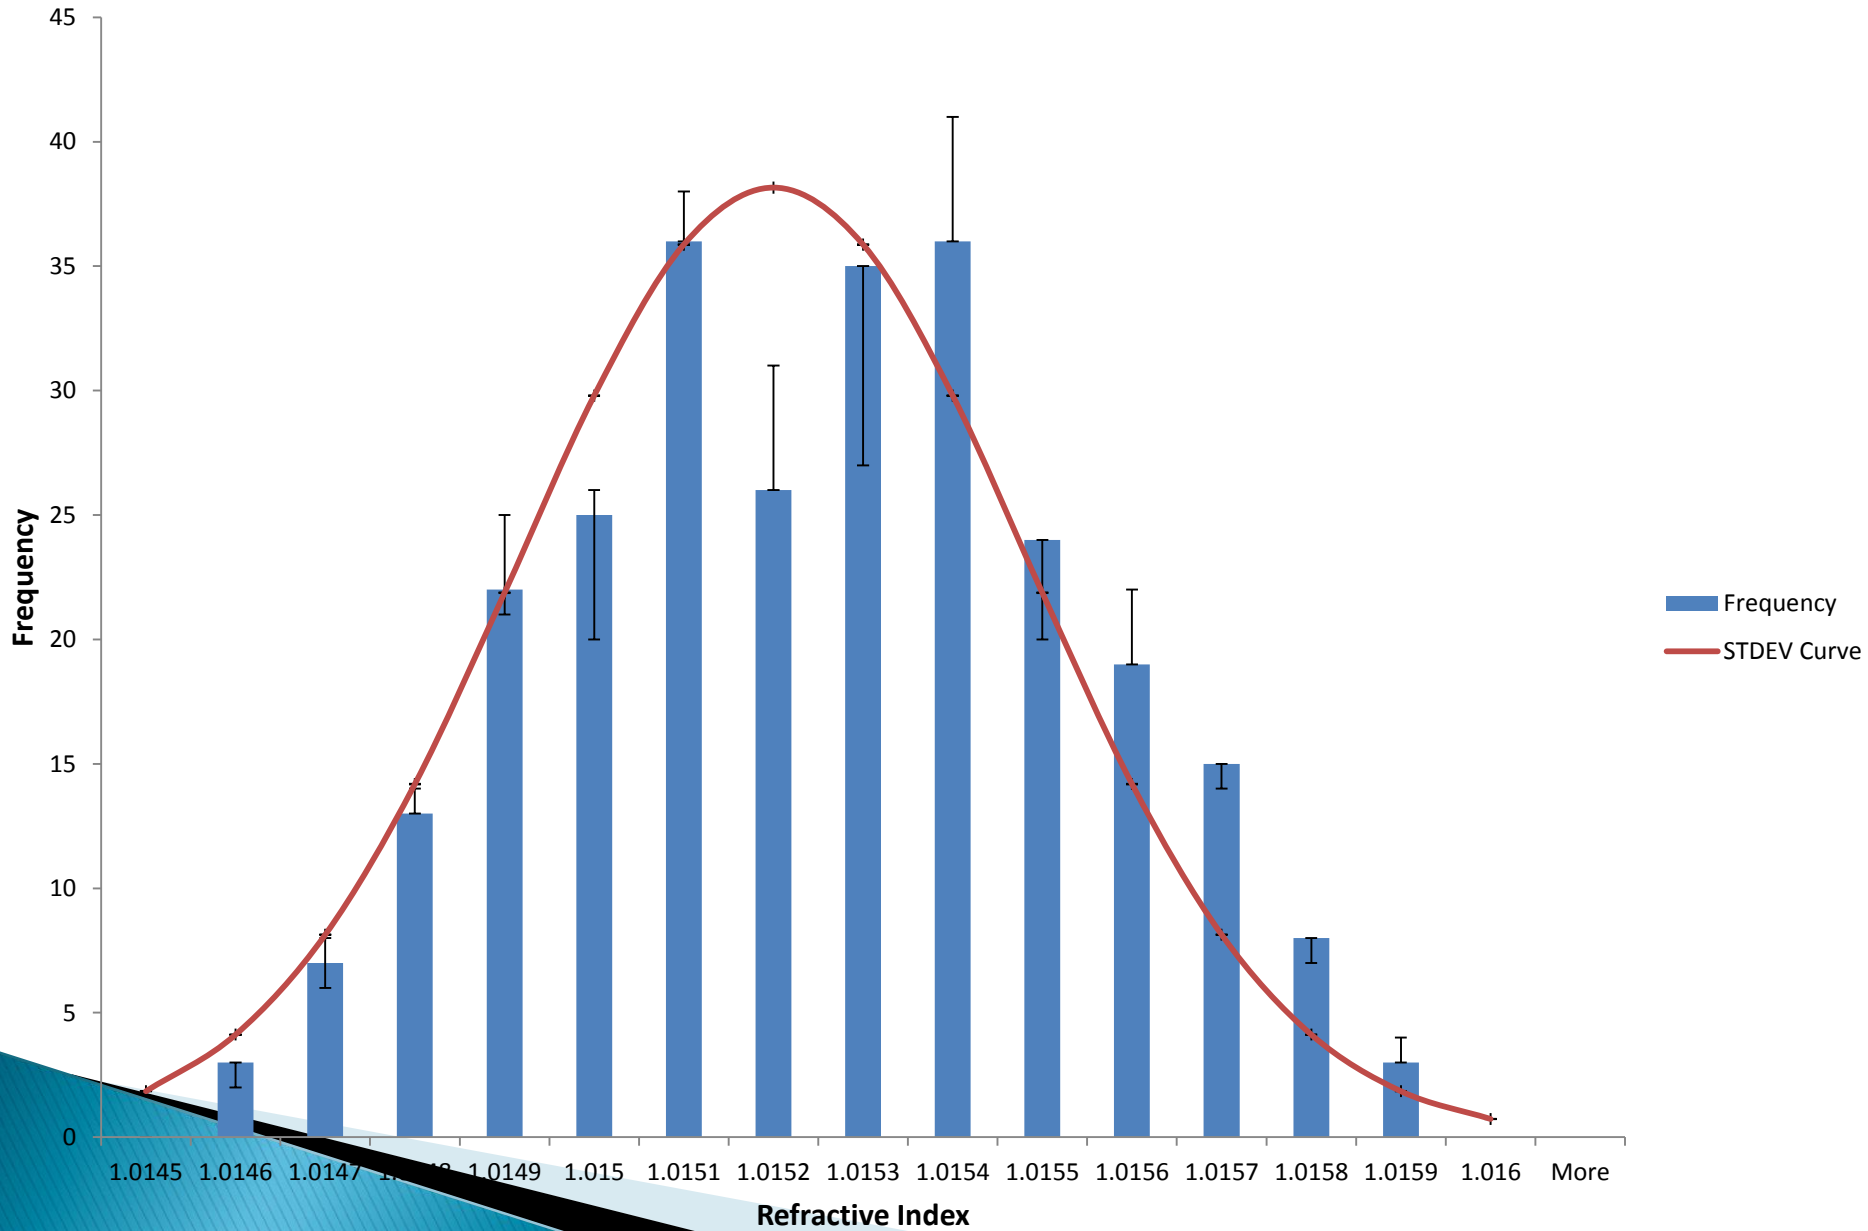

# Uncertainty

- ▶ Assumed the systematic uncertainty to be .01
- ▶ Found how many tiles would either leave or come into each bin if the uncertainty was taken into account
- ▶ Made the number of tiles that changed bins the error bars for each bin
  - The uncertainty changed for each bin
  - Dr. Horn suggested we review uncertainty with her later in the summer

# Refractive Index 1.015

Mean 1.015

STDEV .0003

# SP-30 Refractive Index

- ▶ We have measured 191 SP-30 tiles
  - Starting to measure SP-20s
- ▶ We found that the SP-30s tended to disperse the light more than SP-15s (creating a spot or pattern rather than a beam)
- ▶ This is an edited graph of the data:
  - Refractive indices of 1.033 to 1.039 removed
  - One tile was ~2 mm thinner on one end than the others and the other tile was very chipped and cloudy

# Refractive Index SP-30

Mean 1.03

STDEV .0008

# Humidity

Tile Number	Refractive Index Before	Refractive Index After	Difference
15.022B	1.0152 +/- .01	1.015 +/- .01	- .0002
15.112B	1.0158 +/- .01	1.0156 +/- .01	- .0002
15.122 B	1.0153 +/- .01	1.0153 +/- .01	0
15.127B	1.0149 +/- .01	1.0151 +/- .01	+ .0002
